

Cadastral Community Leithaprodersdorf, Provincial Law Gazette No 4/1976

The 'Frauenwiesen' situated at the northern edge of the Leithagebirge Mountains near Loretto are among the most beautiful and botanically valuable meadows in the Burgenland. The geological underground of the area covering about 13 ha and declining slightly to the north-west consists of tertiary pannonic silty clay and sands.

Soil formation is significantly influenced by the springs originating from the slopes of the near Leithagebirge Mountains. Due to the different site conditions ranging from long-lasting wetness near the spring outlets to early dryness in higher altitudes, several types of grassland can be found. The ecological spectrum ranges from a Brown Bog-Rush-calcareous fen and Small Sedge-marsh over Purple Moor Grass-'Streuwiesen' (traditionally these meadows were only mown once a year in autumn and the cuttings were used as bedding in stables) to the Erect Brome Semi-Dry grasslands.

Naturschutzgebiet
Frauenwiesen

EM-Nr.: 2
Bereich: Elmatal
SOZ-Landgebietscode:
LUBI-Nr.: 47106
Fläche: 15 ha
Seehöhe: 708 m
Koordinaten:
10°32'47.00"E 53°12'
Schutzgebiet:

OK 11 Elmatal
M 1:10.000
